

## **METRO ETHERNET**

ICG's Metro Ethernet is a flexible transport service that provides connectivity across the local metropolitan geography using Ethernet as the core protocol. This allows you to support broadband applications such as LAN interconnection and IP-VPN.

The service applications presently offered are: on-net point-to-point and on-net point-to-multi-point connectivity. This allows you to connect single or multiple enterprise locations within ICG's on-net building footprint.

Metro Ethernet supports the following transmission speeds:

- 10Mbps to 100Mbps (in increments of 10Mbps) -- Fast Ethernet
- 1Gbps (1000Mbps)-- Gig-E

ICG also offers Dedicated Internet Access (DIA) with Ethernet handoff.
